

## IMMERSIVE/DARK RIDES

Immersive rides are a type of entertainment experience that typically involves a motion-based attraction where riders are transported to a different world or environment, often through the use of 3D visuals, sound effects, and other special effects, through the use of technology, storytelling, and design to create a fully immersive environment for riders.

The system is supported with state-of-the art synchronized Audio-Visual & Lighting equipment with curated, customized Audio-Visual Content of typically 3 - 10 minutes, designing these rides to fully immerse riders in the experience, making them feel as if they are part of the story or adventure.

Examples of immersive rides include virtual reality experiences, dark rides, simulators, and roller coasters with theming and special effects. They are often found in theme parks, amusement parks, and other entertainment venues.

Immersive rides can provide a thrilling and memorable experience for riders, as they allow them to escape reality and enter into a completely different world. They are also popular because they appeal to a wide range of ages and interests, from children who love the fantasy elements, to adults who enjoy the technology and storytelling aspects.
